^a Incidence rate is calculated by dividing the total number of confirmed cases in a 7-day period by the population size, and then multiplying by 100,000. It takes into account the size of the population, and can be compared to other regions. It's trend (increasing or decreasing) suggests the trajectory of transmission within a region. ^b Percent positivity is calculated by dividing the number of tests with a positive result by the total number of tests processed during the same time frame, and then multiplying by 100. A higher percent positivity suggests higher community transmission and that there are likely more people with COVID-19 in the community who haven't been tested yet.
